TRANSPORTATION MANAGEMENT PROJECT

Transportation Management System (TMS)

Amrit, Department of IT / SCRIET CCSU Meerut

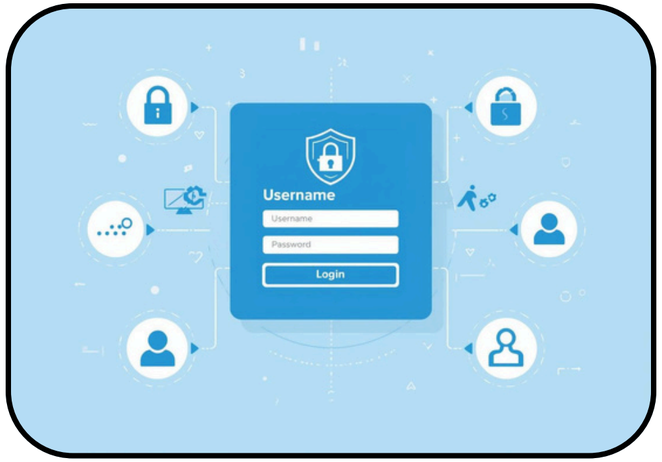
Introduction to the Transportation Management System (TMS)

The TMS aims to **streamline logistics**, enhancing vehicle, route, and assignment management for greater efficiency and effectiveness.

Project Goals & Objectives

Efficient System

Enhances overall transportation management efficiency.



Secure Login

Provides safe access to authorized users.

Centralized Dashboard

All essential information in one place.

Project Goals & Objectives (cont.)

Vehicle Management

Manage vehicles effectively with real-time data.

Route Assignments

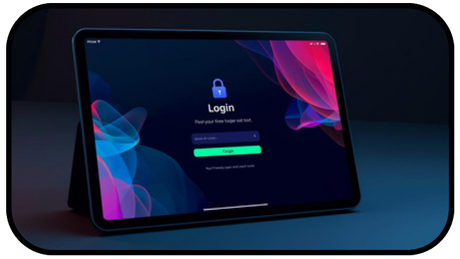
Assign vehicles to optimal routes seamlessly.

Analytics Reporting

Generate insightful reports for strategic decisions.

Target Users and Their Responsibilities

The system is designed for **administrators, logistics managers, and operators** to efficiently manage transportation operations.



Login

Secure access to the system platform

Dashboard

Centralized view of system operations

Vehicle

Manage and track all transportation vehicles

Route

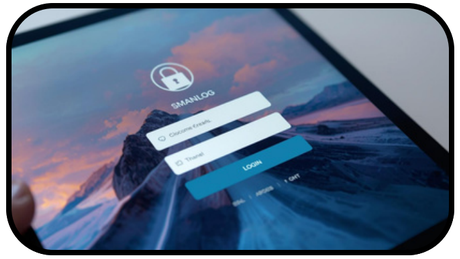
Plan and optimize transport routes efficiently

Assignment

Allocate tasks and monitor progress effectively

Analytics

Insights into performance and usage metrics



System Login

Users securely access their accounts online.

Add Vehicle

Easily input and manage vehicle information.

Define Route

Set optimal paths for efficient travel.

Create Assignment

Assign vehicles to specific routes easily.

View Assignments

Track progress and status of tasks.

Update Status

Keep assignments current with real-time updates.

Data Insights

Visual representation of key performance metrics

Performance Metrics

Overview of system efficiency and effectiveness

User Engagement

Monitoring user interactions and feedback

Usage Statistics

Tracking system usage trends over time

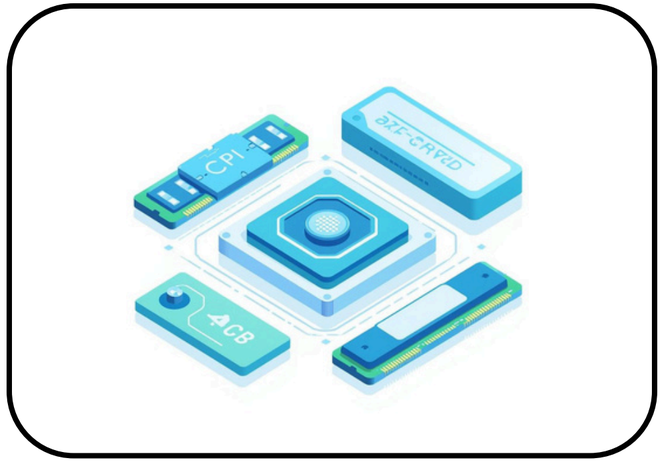
Predictive Analysis

Anticipating future trends based on data

Reporting Tools

Generating detailed reports for stakeholders

Technical Requirements Overview

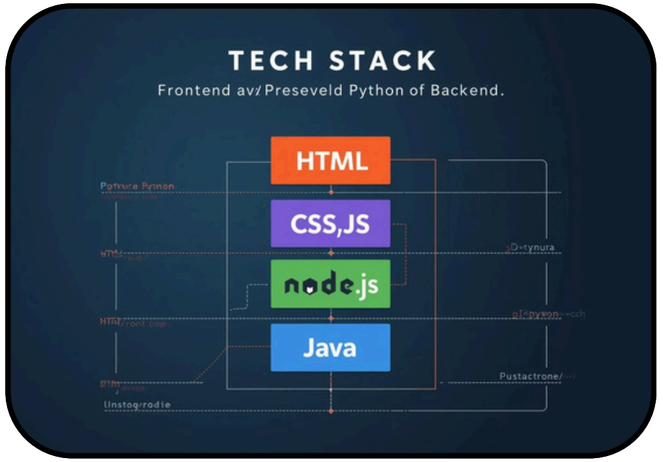


Hardware

Minimum specifications for optimal performance.

Software

Compatible operating systems and browsers listed.



Tech Stack

Technologies utilized for system development.

Understanding the Three-Tier Architecture of TMS

The TMS utilizes a **three-tier architecture** to enhance scalability, maintainability, and efficient data management strategies.

Login

Secure access to user accounts.

Vehicle Management

Efficient management of vehicle information.

Route Management

Define and optimize transportation routes.

Assignment Management

Track and manage vehicle assignments effectively.

Analytics

Generate insights for operational efficiency.

Database Design Overview

Users

Database contains crucial user information.

Vehicles

Data structure for managing vehicle details.

Routes

Information on defining transportation routes.

Assignment Management Overview

Assignment ID

Unique identifier for each assignment.

Vehicle ID

Links assignment to a specific vehicle.

Route ID

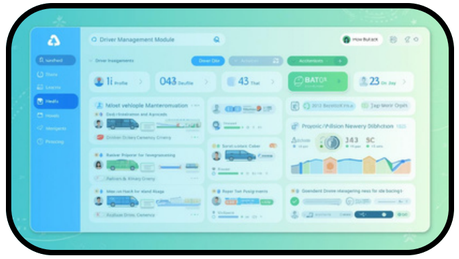
Defines the path that the vehicle takes.

Testing and Validation Outcomes Overview

The system passed 28 out of 30 test cases, ensuring functionality and reliability for transportation management tasks.

GPS Tracking

Real-time location updates for enhanced logistics.



Driver Management

Centralized platform for driver assignments and updates.

Scheduling Algorithms

Optimized routes and schedules for better efficiency.

Notification System

Timely alerts for assignments and updates.

Thank You

Appreciation for attention and support.
